Substituting for  $y$  and solving for  $x$  we have These results involve the imaginary unit already noticed in 112. Numbers of the type  $a + 6\sqrt{-1}$  are discussed further in 195. For the present we will regard such results as merely indicating that the conditions stated by the equations cannot be fulfilled by real numbers. This means that the curve and the line have no point in common, as is evident on constructing the graphs. By proceeding as in 134 we find that the line  $y = a$  is tangent to the curve  $y = x^2 + 3x + 5$ . Clearly all lines  $y = a$ , in which  $a$  is greater than 11, are above this line and hence cut this curve in two points. All such lines for which  $a$  is less than 11 are below the line  $y = a$  and hence do not meet the curve at all. Solving  $y = a$  and  $y = x^2 + 3x + 5$  for  $x$  by first substituting  $a$  for  $y$  we have  $x^2 + 3x + 5 = a$ . If  $a$  is the number under the radical sign is positive, and there are two real and distinct values of  $x$ . Hence the line and the curve meet in two points. If  $a$  is less than 11, the number under the radical sign is negative. Consequently the values of  $x$  are...
